

AGRO BRAIN IA

General description

AgroBrain IA is an intelligent platform designed for agribusiness that centralizes operational information, analyzes productivity indicators, and generates recommendations for decision-making

The platform aims to reduce reliance on manual reports, improve operational visibility, and support supervisors and managers through data-driven analysis and recommendations

Problem

Agribusiness generates large amounts of information related to production, agricultural tasks, personnel, quality, and performance

However:

- The information is scattered across multiple systems
- There are delays in generating reports
- Users depend on analysts to obtain specific information
- Problems are often detected only after they have already occurred
- Decision-making relies primarily on staff experience

General Objectives

To develop an intelligence platform capable of consulting, analyzing, and recommending operational actions using real-time agricultural and production information

Specific objectives

- Centralize operational indicators
- Automate frequently asked questions
- Detect productivity deviations
- Generate early warning
- Recommend corrective actions
- Improve decision making
- Reduce reliance on manual reports
